App concept: Emapp

An **application** that displays the information about the **physical** and **technical potential** of **renewable energy** resources in **spatiotemporal domains**. In other words, it's an app that offers information in a Buienradar-esque manner about what kind of energy the weather has to offer.

The app is made to connect directly to weather satellites to provide lightning-fast results.

Data is collected from various points all over the region so it can provide the most accurate results.

It collects data in terms of *realtime* (like windspeed and solar energy) and on a *periodic* base through Open Data.
